# Click Coding Coding with Click Modular Router

Bart Braem Johan Bergs

University of Antwerp iMinds - MOSAIC Research Group

October 2014

#### Outline

- Coding
- 2 Tools

### Do it yourself

Let's make an example element

- 1 input, 1 output, Push
- Configure a packet size threshold, if larger: drop packet

Download the source code online to avoid copy errors at http://www.pats.ua.ac.be/software/click

#### Element header

#### Necessary in the header:

- Include-guard macros
- Click element macros
- Include click/element.hh
- The class declaration containing 3 special methods:

```
const char *class_name() const
const char *port_count() const
const char *processing() const
```

#### Element header

#### Necessary in the source file:

- Include click/config.hh! first!
- CLICK\_DECLS macro
- CLICK\_ENDDECLS macro
- EXPORT ELEMENT macro
- Implementation of the methods

### simplepushelement.hh

```
#ifndef CLICK SIMPLEPUSHELEMENT HH
#define CLICK SIMPLEPUSHELEMENT HH
#include <click/element.hh>
CLICK DECLS
class SimplePushElement : public Element {
 public:
  SimplePushElement();
   ~SimplePushElement();
  const char *class name() const { return "SimplePushElement"; }
  const char *port count() const { return "1/1"; }
  const char *processing() const { return PUSH; }
  int configure(Vector<String>&, ErrorHandler*);
  void push(int, Packet*);
 private:
  uint32 t maxSize;
};
CLICK ENDDECLS
#endif
```

### simplepushelement.cc I

```
#include <click/config.h>
#include <click/confparse.hh>
#include <click/error.hh>
#include "simplepushelement.hh"
CLICK DECLS
SimplePushElement::SimplePushElement() {}
SimplePushElement::~SimplePushElement() {}
int SimplePushElement::configure(Vector<String> &conf, ErrorHandler *errh) {
 if (cp va kparse(conf, this, errh, "MAXPACKETSIZE", cpkM, cpInteger,
     &maxSize, cpEnd) < 0) return -1;
 if (\max Size \le 0) return errh->error(\max Size Should be larger than <math>0");
 return 0:
void SimplePushElement::push(int, Packet *p){
```

# simplepushelement.cc II

```
click_chatter("Got a packet of size %d", p->length());
if (p->length() > maxSize) p->kill();
else output(0).push(p);
}
CLICK_ENDDECLS
EXPORT_ELEMENT(SimplePushElement)
```

#### What's in a name

To avoid confusion, we recommend to:

- Make the ElementName CamelCase
- Use that name in the class\_name macro
- Use that name in lowercase for the header (.hh) and source (.cc) files
- Use that name in uppercase, with CLICK\_ prepended, for the include guards

#### simplepullelement

simplepullelement.hh:

```
class SimplePullElement: public Element {
 public: ...
   const char *processing() const { return PULL; }
   Packet* pull(int);
simplepullelement.cc:
Packet* SimplePullElement::pull(int) {
 Packet* p = input(0).pull();
 if(p == 0) return 0;
 click chatter("Got a packet of size %d",p->length());
 if (p->length() > maxSize){
   p->kill();
  return 0;
 } else return p;
```

#### simpleagnosticelement

```
simpleagnosticelement.hh:
class SimpleAgnosticElement: public Element {
 public: ...
   const char *processing() const { return AGNOSTIC; }
   void push(int, Packet *);
   Packet* pull(int);
};
simpleagnosticelement.cc
void SimpleAgnosticElement::push(int, Packet *p) {
 // see push element
Packet* SimpleAgnosticElement::pull(int) {
 // see pull element
```

#### simpleagnosticelement11

```
simpleagnosticelement11.hh:
class SimpleAgnosticElement11: public Element {
 public: ...
   const char *processing() const { return AGNOSTIC; }
   const char *port count() const { return "1/1"; }
   Packet *simple action(Packet *);
};
simpleagnosticelement11.cc
Packet* SimpleAgnosticElement11::simple action(Packet *p){
 click chatter("Got a packet of size %d",p->length());
 if (p->length() > maxSize){
   p->kill();
   return 0:
 } else return p:
```

#### Port count

Defined by **const char** \*port\_count() **const**. Can return:

- "1/1": one input port, one output port
- "1/2": one input port, two output ports
- "1-2/0": one or two input ports and zero output ports.
- "1/-6": One input port and up to six output ports.
- "2-/-": At least two input ports, any number of output ports.
- "3"!: Exactly three input and output ports. (If no slash appears, the text is used for both input and output ranges.)
- "1-/=": At least one input port and the same number of output ports.
- "1-/=+": At least one input port and one more output port than there are input ports.

## Parsing configurations with cp\_va\_kparse I

#### Call this function on

- the configuration (conf)
- the element (this)
- the errorhandler (errh)
- an argument list
- a closing mark (cpEnd)

#### Check the return value (C-style):

- 0: all parsing went fine
- Negative: problems detected, configure should return -1

# Parsing configurations with cp\_va\_kparse II

```
int MyElement::configure(Vector<String> &conf, ErrorHandler *errh) {
 String data;
 uint32 t limit = 0;
 bool stop = false:
 if (cp va kparse(conf, this, errh,
   "DATA". cpkP+cpkM, cpString, &data,
   "LIMIT", cpkP, cpUnsigned, &limit,
   "STOP", 0, cpBool, &stop,
  cpEnd) < 0) return -1;
```

#### Arguments to cp\_va\_kparse I

#### Argument name

Type: const char \*

• Example: "DATA".

#### Parse flags

Type: int

Zero or sum of cpkP, cpkM, and cpkC.

If the parse flags contain cpkC, then a confirmation flag comes next:

- Type: bool \*
- This flag is set to true if an argument successfully matched the item and false if not.

#### Arguments to cp\_va\_kparse II

Argument type: Defines the type of argument read from the configuration string

Type: CpVaParseCmd

Example: cpString, cpIPAddress, cpInteger

Optional parse parameters

Determined by the argument type

 For example, cpUnsignedReal2 takes a parse parameter that defines how many bits of fraction are needed.

Result storage: Determined by the argument type

### Parse flags

- cpkN (=0): default, no special requirements
- cpkM: Mandatory argument
- cpkP: Positionally specified argument
- cpkC: Confirmation of presence needed
- cpkD: Deprecated argument

To combine just sum them, e.g. cpkD+cpkC: deprecated argument that will be confirmed

## Cp\_va\_kparse: example

```
int MyElement2::configure(Vector<String> &conf, ErrorHandler *errh) {
  bool p_given;
  uint32_t p = 0x10000;
  IPAddress addr, mask;

if (cp_va_kparse(conf, this, errh,
    "P", cpkC, &p_given, cpUnsignedReal2, 16, &p,
    "NETWORK", 0, cpIPPrefix, &addr, &mask,
    cpEnd) < 0)
  return -1;
  ...
}</pre>
```

## Cp\_va\_kparse: example 2 I

#### Will this match:

- P 5, NETWORK 192.168.0.3
- NETWORK 1.2.3.4, P5
- P 5
- NETWORK 192.168.0.3
- (nothing)

## Cp\_va\_kparse: example 2 II

#### How about

#### Will this match:

- P 5, NETWORK 192.168.0.3
- NETWORK 1.2.3.4, P5
- P 5
- NETWORK 192.168.0.3
- (nothing)

#### Parsing elements I

#### Elements might need other elements

- Pass them in the configuration
- Check their name and type
- Calling public methods and accessing public members is possible

In Click script:

SimpleElement(IPRouteTable);

or

myIpRouteTable::IPRouteTable; SimpleElement(myIpRouteTable);

### Parsing elements II

```
Add an element to the header:

#include "usedelement.hh"
class ElementUser: public Element {
  private:
    UsedElement* used;
}

Use the element in the C++ code
ElementUser::push(...) {
  used->doSomething(...);
}
```

### Parsing elements III

Check and configure the element in the configure function:

```
int ElementUser::configure(Vector<String> &conf, ErrorHandler *errh){
   UsedElement* tempUsedElement;
   int res = cp_va_kparse(conf, this, errh, "ANELEMENT", 0,
        cpElementCast, "UsedElement", &tempUsedElement, cpEnd);

if(res < 0) return res; // parsing failed

used = tempUsedElement;
return 0;
}</pre>
```

### Click library functions

The C++ STL cannot be used in the kernel

- Click provides its own implementation, use it
- Equivalents to most STL datastructures available
- E.g. vector, hashmap, ...

Additional types: Timers and tasks to schedule actions, see later Additional functions:

- Manipulate strings
- Manipulate packets
- E.g. click\_gettimeofday(struct timeval \*tv)

#### Click containers

Overview of the most important types

- Vector
- HashMap (will become HashContainer)
- String

#### Click STL: vector I

```
Constructor: straightforward template
```

```
Vector<SomeThing> myvector;
```

```
Even better: typedef it for reuse
```

```
Typedef Vector<SomeThing> SomeThingVector;
```

Use macro magic for template instantiation

```
// generate Vector template instance
#include <click/vector.cc>
#if EXPLICIT_TEMPLATE_INSTANCES
template class Vector<SomeThing>;
#endif
```

#### Click STL: vector II

```
Add things to it: myvector.push back(some thing);
Use iterators to walk over it
for (SomeThingVector::const iterator i = myvector.begin(); i!=
    myvector.end(); i++){}
 doSomeThingWith(*i);
And remove things with iterators
myyvector.erase(i);
Or pop it as a stack/heap
myvector.pop front(); myvector.pop back();
```

# Click STL: hashmap example I

```
#ifndef AODVSETRREPHEADERS HH
#define AODVSETRREPHEADERS HH
#include <click/element.hh>
CLICK DECLS
typedef HashMap<Packet*, IPAddress*> DestinationMap;
class AODVSetRREPHeaders : public Element {
 public:
  virtual void push (int, Packet *);
  void addRREP(Packet*,IPAddress *);
 private:
  DestinationMap destinations:
};
CLICK ENDDECLS
#endif
```

## Click STL: hashmap example II

```
AODVSetRREPHeaders::AODVSetRREPHeaders():
 destinations(){}
void AODVSetRREPHeaders::push (int port, Packet * p){
 // packet should be in destinations
 DestinationMap::Pair * pair = destinations.find pair(packet);
 assert(pair);
 IPAddress* destination = pair->value;
 ... // do something with destination
 delete pair—>value; // free memory properly
 destinations.remove(packet); // then remove from map
```

## Click STL: hashmap example III

```
void AODVSetRREPHeaders::addRREP(Packet* rrep, IPAddress * ip){
    destinations.insert(rrep,ip);
}

// macro magic to use bighashmap
#include <click/bighashmap.cc>
#if EXPLICIT_TEMPLATE_INSTANCES
template class HashMap<Packet*, IPAddress*>;
#endif
```

## Click STL: string

```
Use it when manipulating C strings

String test = "mytest";

Use standard operators to modify it test += "should say hello";

When used in click_chatter, convert it click_chatter("my string is %s",test.c_str());
```

#### Packet formats

You want to make your own packets, here's how Format closely mirrors RFCs
Use structs

- Fill them with signed/unsigned ints, in addr, ...
- Easy packet manipulation
- Avoids dirty operations with chars and bytes
- Define those in shared headers for reuse

#### Create your packet format

```
struct MyPacketFormat{
  uint8_t type; // 8 bit = 1 byte
  uint32_t lifetime; // 32 bit = 4 bytes
  in_addr destination; // IP address
};
```

### Click data types

Click already defines lots of data types for you, see include/clicknet:

- click ether
- click ip
- click\_udp
- click\_tcp
- etc.

#### Creating a packet

Provide headroom and tailroom:

```
int tailroom = 0;
int packetsize = sizeof(MyPacketFormat);
int headroom = sizeof(click_ip)+sizeof(click_udp)+sizeof(click_ether);
WritablePacket *packet = Packet::make(headroom,0,packetsize, tailroom);
if (packet == 0 )return click_chatter( "cannot make packet!");
memset(packet->data(), 0, packet->length());
MyPacketFormat* format=(MyPacketFormat*)packet->data();
format->type = 0;
format->lifetime = htonl(counter);
format->destination = ip.in_addr();
```

Destroy with packet—>kill(), only way to free your memory correctly!

### Processing a packet I

```
Cast the packet data to the right format
```

```
// start with the first part
my_header * head = (my_header *) (packet->data());
// continue with later bytes
int offset = sizeof(my_header)
second_header * h2 = (my_second_header *)(my_header+1);
Use the format to read from and write to
if (head->somefield == 2){
   head->otherfield = htons(38);
   ...
}
```

Packet Manipulation Timers and Tasks

# Processing a packet II

#### Only write to writable packets

```
WritablePacket *q = p- uniqueify();
// only use q now!
q->somefield = newvalue
```

# Manipulating packet size

#### Add data with push(unsigned len)

- Inserts the data at the beginning of the packet
- Create enough headroom, otherwise expensive push!

#### Remove data with pull(unsigned len)

- Removes the data at the beginning of the packet
- Frees headroom

Equivalents at tail of packet: put and take

# Manipulating packet annotations

```
Get IP header:
```

```
packet->ip_header();
```

Set IP header of length len:

```
packet—>set ip header(const click ip* header, unsigned len);
```

Similar operations exist for TCP and UDP headers Both operations require header annotations, set by the MarkIPHeader element!

# Simple timer I

```
Runs the run timer function upon expiry
class MyElement: public Element {
 public:
  void run timer(Timer*);
 private:
   Timer timer:
MyElement::MyElement(): timer(this){}
int MyElement::configure(Vector<String> &conf, ErrorHandler *errh){
 timer.initialize(this);
 timer.schedule after msec(1000);
 return 0;
```

## Simple timer II

```
void MyElement::run_timer(Timer* t){
  click_chatter("we are now 1 second later");
  timer.schedule_after_msec(1000);
}
```

#### Advanced timer with extra data la

Run your callback function upon expiry with data, because you want to know some context information.

Code is a little bit harder:

```
class MyElement: public Element{
  private:
    struct TimerData{ // callback data
      MyElement* me;
      Something* s;
  }
  static void handleExpiry(Timer*, void *); // callback function
  void expire(const MyElement &, TimerData *);
}
```

#### Advanced timer with extra data II

```
void MyElement::someFunction(){
 TimerData* timerdata = new TimerData();
 timerdata -> s = new Something();
 timerdata -> me = this;
 Timer t = new Timer(\&MyElement::handleExpiry,timerdata);
 t->initialize(this);
 t->schedule after msec(2500);
void MyElement::handleExpiry(Timer*, void * data){
 TimerData * timerdata = (TimerData*) data;
 assert(timerdata); // the cast must be good
 timerdata->me->expire(*timerdata->s,timerdata);
```

Writing custom element The Click STL Packet Manipulation Timers and Tasks Handlers References

### Advanced timer with extra data III

```
void MyElement::expire(const Something & s, TimerData * timerdata){
   // do things with Something
   // timerdata passed to free memory after timer expiry
}
```

Writing custom elements The Click STL Packet Manipulation Timers and Tasks Handlers References

# Adding handlers

Add to element by overriding add\_handlers

- Callback with function pointers
- Refer to static methods

Use add\_read\_handler and add\_write\_handler

# Adding a write handler I

```
class WriteElement: public Element{
 public:
   static int handle(const String &conf, Element *e, void * thunk,
     ErrorHandler * errh);
   void add handlers();
int WriteElement::handle(const String &conf, Element *e, void * thunk,
     ErrorHandler * errh){
 WriteElement * me = (WriteElement *) e;
 if(cp va kparse(conf, me, errh, ..., cpEnd) < 0) return -1;
 me->doSomethingWithParsed(...);
 return 0:
```

Writing custom elements
The Click STL
Packet Manipulation
Timers and Tasks
Handlers
References

# Adding a write handler II

## Adding a read handler

```
class ReadElement: public Element{
 public:
  static String handle(Element *e, void * thunk);
  void add handlers();
String ReadElement::handle(Element *e, void * thunk){
 ReadElement * me = (ReadElement *) e;
 return me->giveSomeValue(...);
void ReadElement::add handlers(){
 add read handler("a handle", &handle, (void *)0);
```

Writing custom elements The Click STL Packet Manipulation Timers and Tasks Handlers References

### References I

Click website: http://www.read.cs.ucla.edu/click/

- Element documentation (by name or category)
- Programming Concepts
- Doxygen documentation

Click thesis (online: publications, Ph.D. thesis)

- Comprehensive documentation of every concept
- Interesting chapters for development:
  - Introduction
  - Architecture: elements, packets, connections, push and pull, packet storage, element implementation
  - Language: syntax, configuration strings, compound elements

Writing custom elements The Click STL Packet Manipulation Timers and Tasks Handlers References

### References II

- /elements/: dozens of elements, some more trivial than others
- /include/: the Click STL headers

### Introduction

Click graphs can get large, sometimes you need visual checks Helps you verify the situation Tools available:

- click-flatten
- click-viz

### click-flatten

Flattens out compound elements for click-viz, the resulting router will do exactly the same Located in tools/click-flatten

# click-flatten (continued)

```
tools/click—flatten/click—flatten ping—3.click
# 33 "ping—3.click"
AddressInfo@1 :: AddressInfo(senderaddr 10.0.0.1 1A:7C:3E:90:78:41);
# 34 "ping—3.click"
AddressInfo@2 :: AddressInfo(receiveraddr 10.0.0.2 1A:7C:3E:90:78:42);
# 40 "ping—3.click"
Null@5 :: Null;
# 43 "ping—3.click"
Null@6 :: Null;
# 4 "ping—3.click"
sender/ICMPPingSource@1 :: ICMPPingSource(senderaddr, receiveraddr);
...
```

# click-flatten (continued)

```
sender/ICMPPingSource@1 -> sender/IPPrint@2
 -> sender/EtherEncap@3
 -> sender/ToDump@4
 -> Null@5
 -> receiver/Strip@1
 -> receiver/MarkIPHeader@2
 -> sender/IPPrint@6
 -> sender/Discard@7;
sender/filter [1] -> sender/IPPrint@8
 -> sender/Discard@9:
```

#### click-viz

Basic visualization of Click scripts, renders dotty output (Graphviz software)
Usage:

```
tools/click-flatten/click-flatten ping-1.click | tools/click-viz/click-viz | dot -Tpng > ping-1.png
```

# Gnu Debugger

A low-level, well known and very powerful debugger Basics:

- gdb userlevel/click
- run someclickscript.click
- (wait for crash)
- bt
- quit

## valgrind

A memory debugger, shows and debugs invalid memory access Basic usage: valgrind userlevel/click somescript.click Errors and warnings might come from glibc or Click elements, and might appear in other elements.

Outline Coding Tools Acknowledgements

A big thank you to Michael Voorhaen, one of the original authors of these slides.
